Year-end goal progress comments

FY2026 Performance Review | Rakesh Sahu

1. Developmental

Throughout FY2026, I strengthened my Snowflake knowledge through project work, Snowflake Summit, and other Snowflake events. My learning covered Snowflake lineage, Cortex capabilities, dbt within the Snowflake ecosystem, semantic views, dynamic tables, and Streamlit applications.

I applied my Snowflake skills to data profiling, validation, and analysis across Precision Lender, L1 data products, and DEO intakes. I also developed consumption tables and views for CDGC lineage to support upstream and downstream impact analysis. SnowPro certification was not completed this year.

2. Risk Management FY2026

Throughout FY2026, I created, reviewed, and maintained DRDs, STTMs, and source onboarding documentation using DEO standards. I coordinated reviews with Business, the Chief Data Office, Architecture, and Development teams and maintained analysis artifacts in the designated SharePoint repository.

I updated the L1 data product DRD template to improve requirements coverage and completed DRD backfilling for Credit Card, Loan, Deposit, and Business Unit data products. This addressed existing documentation gaps and improved traceability for future development and support.

I also identified a significant treasury production data issue and worked with Production Support to resolve it. All required compliance training was completed within the assigned deadlines.

3. Technology Management - DEO Roadmap

During FY2026, I led data analysis across Precision Lender Phase 2, L1 data products, and DEO intake initiatives. Precision Lender Phase 2 went live in September with loan, commitment, and deposit enhancements and a new Treasury Services feed. I also supported the Phase 1 production implementation of Credit Card, Deposit, Loan, and Client 360 data products.

My work included requirements gathering, DRD preparation and review, STTM validation, source onboarding reviews, data profiling, and ongoing support to offshore development teams.

Beyond project delivery, I worked with the lineage and platform teams to validate CDGC lineage extraction into Snowflake and created consumption tables and views used for AFS, USWM, and ad hoc impact analysis. The IICS production implementation is planned for October.

Goal self-assessments

FY2026 Performance Review | Developmental and Risk Management

1. Developmental

I expanded my Snowflake knowledge through a combination of hands-on delivery, technical investigation, and participation in Snowflake Summit and other Snowflake events. I learned about Snowflake lineage, Cortex, dbt integration, semantic views, dynamic tables, and Streamlit, developing a better understanding of how these capabilities could support CNB's analysis and governance needs.

I applied my existing and newly developed skills to SQL analysis, data profiling, validation, and data product requirements. A practical example was creating Snowflake consumption tables and views for extracted CDGC lineage, allowing analysts to work with upstream and downstream dependencies in a consistent format.

My development extended beyond individual learning. I shared the lineage approach and findings with colleagues and helped them use the framework for their impact assessments. Although I did not complete SnowPro certification, I made meaningful progress in practical platform knowledge and its application to the team's work.

2. Risk Management FY2026

I maintained a consistent focus on documentation quality, requirements traceability, and data quality across my assigned initiatives. I completed all required compliance training on time and followed DEO standards for preparing, reviewing, and maintaining analysis artifacts in the designated repository.

For Precision Lender Phase 2, I created the Treasury DRD, updated six existing DRDs, and created or updated 20+ STTMs. For L1 data products, I reviewed and validated 50+ STTMs and reviewed 10+ source onboarding requests for completeness and accuracy. Across DEO intakes, I created 10+ DRDs and prepared or supported approval of 15+ STTMs.

I also addressed documentation gaps beyond current project requirements. I led updates to the data product DRD template and completed retrospective DRDs for Credit Card, Loan, Deposit, and Business Unit data products. This provided documented requirements for existing tables and reduced reliance on individual knowledge.

During treasury analysis, I identified a significant production data issue and worked with Production Support to resolve it. I also prepared IICS and Snowflake inventories to help the lineage team identify gaps in CDGC scanning coverage. These contributions strengthened documentation consistency, data traceability, and the team's ability to assess change impacts.

Goal self-assessments

FY2026 Performance Review | DEO Roadmap

3. Technology Management - DEO Roadmap

I took ownership of data analysis across several DEO priorities, working with business stakeholders, the Chief Data Office, Architecture, and offshore development teams to translate requirements into documented, actionable deliverables.

For Precision Lender Phase 2, I led requirements gathering and treasury dataset analysis and supported delivery through production implementation in September. The release included approximately 15-20 major BAU enhancements and a new Treasury Services feed with 20+ attributes. I worked with the development team to transition treasury file preparation to an automated process using Data Lake and Data Hub tables. Treasury and Finance colleagues recognized my contributions through Bravo.

For L1 data products, I led analysis supporting the Phase 1 production implementation of Credit Card, Deposits, Loans, and Client 360. My scope included analysis and DRD activities for approximately eight Credit Card tables, ten Loan tables, six Deposit tables, and 10+ Client 360 tables. I completed 20+ analysis and profiling activities and provided ongoing support to resolve development questions. I also supported 10+ DEO intakes, balancing smaller business requests with broader roadmap commitments.

I advanced the impact analysis automation stretch goal by validating CDGC bulk lineage extraction, preparing IICS and Snowflake inventories, and developing logic to standardize raw lineage. During the proof of concept, I extracted and analyzed lineage for 50+ tables and created consumption tables and views used for AFS, USWM, and ad hoc analysis. I worked with the lineage team on the IICS implementation planned for October and helped colleagues use the framework for their analysis needs.

Competency responses

FY2026 Performance Review | Client First, Collaboration and Excellence

1. Client First

I worked closely with business stakeholders to understand the need behind each request and translate it into clear data requirements. For Precision Lender Phase 2, I partnered with Treasury and Finance to identify the appropriate datasets and support a new Treasury Services feed that expanded the relationship information available in Precision Lender. I also supported enhancements to the existing loan, commitment, and deposit feeds.

Across L1 data products and DEO intakes, I used profiling and source analysis to clarify data definitions, validate assumptions, and resolve questions before development progressed. Treasury and Finance recognition reflected the value of this partnership and my support throughout delivery.

2. Collaboration

I served as a primary point of contact for data analysis across L1 data products, working with the Chief Data Office, business SMEs, Architecture, and offshore developers. I brought the relevant teams together to clarify requirements, resolve data questions, and maintain consistency between the DRDs, mappings, and proposed data models.

For lineage automation, I worked with the CDGC, Platform, and Informatica teams to understand technical constraints and agree on a workable extraction approach. I also supported the Risk Analysis team and other colleagues in using the lineage framework for impact analysis, sharing findings and helping them identify the assets and dependencies relevant to their requests.

3. Excellence

I took ownership of analysis from requirements gathering through development support, with particular attention to the quality of the underlying data and documentation. I supported the production delivery of Precision Lender Phase 2 and four Phase 1 L1 data products while continuing to handle DEO intake requests.

I looked for improvements that would benefit work beyond the immediate assignment. I updated the data product DRD template, completed backfilling for four product areas, and developed reusable lineage consumption tables and views. These improvements gave the team more consistent documentation and a practical way to investigate dependencies without rebuilding the analysis for every request.

Competency responses

FY2026 Performance Review | Integrity and Respect

4. Integrity

I based my analysis and recommendations on source data, documented requirements, and stakeholder confirmation. When definitions or requirements were unclear, I raised the questions with the appropriate SMEs and captured the agreed outcome rather than allowing assumptions to carry into development.

I took responsibility for identifying gaps and following through on them. This included raising a significant treasury production data issue, working with Production Support on its resolution, and addressing missing DRDs for existing data product tables. I maintained analysis artifacts in the approved repository and completed all required compliance training on time.

5. Respect

I worked constructively with colleagues across Business, Risk Analysis, the Chief Data Office, Architecture, Platform, and offshore development teams. I listened to their requirements and constraints, explained analysis findings clearly, and remained available to work through questions during delivery.

I regularly helped colleagues use the lineage framework for their own impact analysis and shared the context behind the results so they could apply it confidently. I also documented findings from previously undocumented processes, making the information available for team reference and reducing dependence on individual knowledge.
